

COLORED PIGMENT PACKS

DESCRIPTION:

CEMTEC COLOR PIGMENT PACKS are pre-measured; iron oxide powder pigments used to integrally color CEMTEC powders. Packs are pre-measured to combine with 50lbs One SPRAY TEXTURE white, STAMPED OVERLAY white, and 2 PART BROOMED OVERLAY white. Portions of the pigments can also be used to color the Antiquing solution. The colors on our chart represent blending of color packs with white based powders that have been sealed with a penetrating sealer.

PRECAUTIONS:

Colors may vary! In all cement based products the coloring is apt to vary from batch to batch. Varying amounts of powder, liquids, heat, wind, sunshine and humidity all have varying effects on the coloring of cement. Because of these variables, CEMTEC cannot be responsible for exact matching of colors to the chart or the finished product; however we offer these suggestions to help create a more uniform product.

- Mix more than one bag at a time, by using a larger mixing vessel you can mix 2, 3 or 4 bags with the color packs. This will create more product at a consistent color.
- Always premix color packs into the liquid before adding powder.
- Mix thoroughly! Powdered pigments have to go through the shearing process of the mixing drill to become completely dispersed.
- Watch the weather. High heat and wind contribute to rapid drying of cement, thus shading of color.

COLOR CATAGORIES FOR 1 LB. PIGMENT PACKS
